

IN THE SPECIFICATION

Please amend the Abstract as follows:

The configuration method for an installation comprising solar protection and/or lighting devices controlled by a central unit comprising a memory, ~~computing means~~microprocessor and a user interface, is characterized in that ~~the method~~ the method comprises an iteration, over all of the solar protection and/or lighting devices, ~~of the following steps:~~and comprises a parameterization step ~~comprising the following~~that includes phases: of entry and recording of data defining the exposure of the opening fitted with the solar protection device with respect to the sun, ~~entry and recording of data defining the type of device,~~ and entry and recording of data defining the maximum desired depth of penetration of the sun into the building, and/or the sought visual comfort; ~~a~~The method further comprises a calculation step of calculation during which, whereby for each device, coefficients for a control algorithm and/or a control algorithm, intended to control the device, are calculated.
